

Shallow_Neural_Nets

December 4, 2017

Instructions: 1) Put the training data and the test data in a folder name "data". Place this folder in the same folder from where you run the jupyter notebook. 2) To get the score for the test data, upload the CSV file "SNN_cont.csv" generated to this competition : ["https://www.kaggle.com/c/porto-seguro-safe-driver-prediction/submit"](https://www.kaggle.com/c/porto-seguro-safe-driver-prediction/submit).

```

KeyboardInterrupt:

```

In [217]: preds = model.predict(X_test)

In [218]: test['predic'] = preds
          test[['id', 'predic']].to_csv('2layer.csv', index = False)

```

2.1 We get a score of 0.211.

One issue is that we are passing categorical variables as is, however we should use some kind of one-hot encoding or other equivalent methods before passing it to the neural network.

2.1.1 Repeating the experiments with only continuous variables! We will get to handling categorical/ordinal in the next notebook

```

In [324]: test['target'] = predics
test[['id', 'target']].to_csv('SNN_cont.csv', index = False)
test = test.drop(['target'], axis = 1)
```

2.1.2 We get a lower error than previously but the score is much worse....this means we are overfitting with 100 nodes in the hidden layer.

Repeating the experiment with just 10 neurons in the hidden layer, and adding one additional layer (2 hidden layers)

The best score we get using this 0.200. Probably we need to add categorical features etc. to get better results...

Update - Another thing we should try before adding additional data (~categorical) is to give the neural network more balanced data (compared to ~95% 0's and 5% 1's that we are giving it right now)

```
In [348]: train = pd.read_csv('data/train.csv')
